## Goal of the project:

Generation of global long-term and properly validated burned area (BA) products to serve the needs of climate modellers.

## Currently available BA products:

### Global

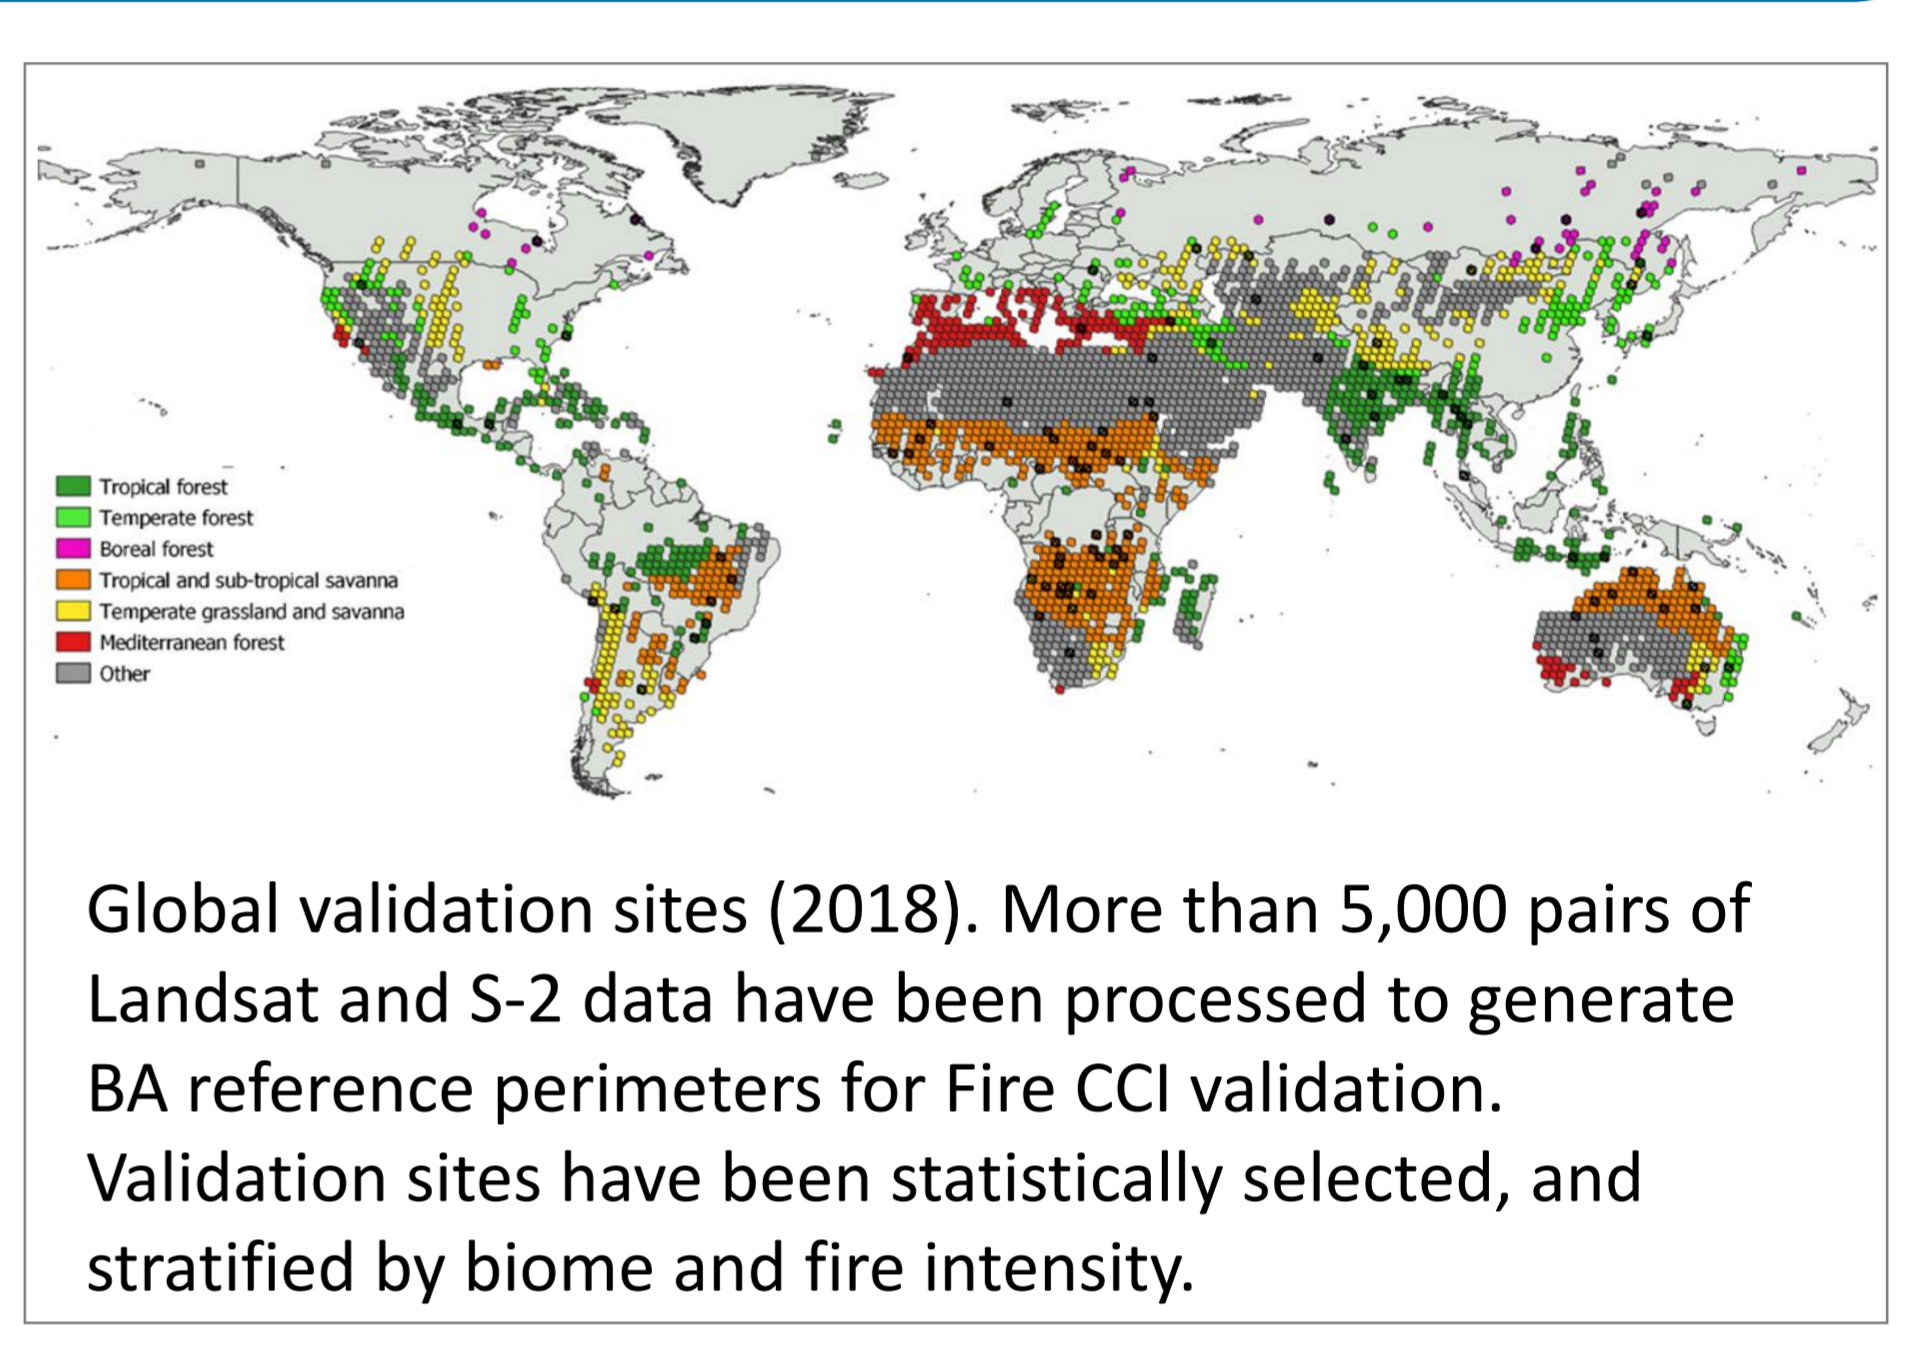

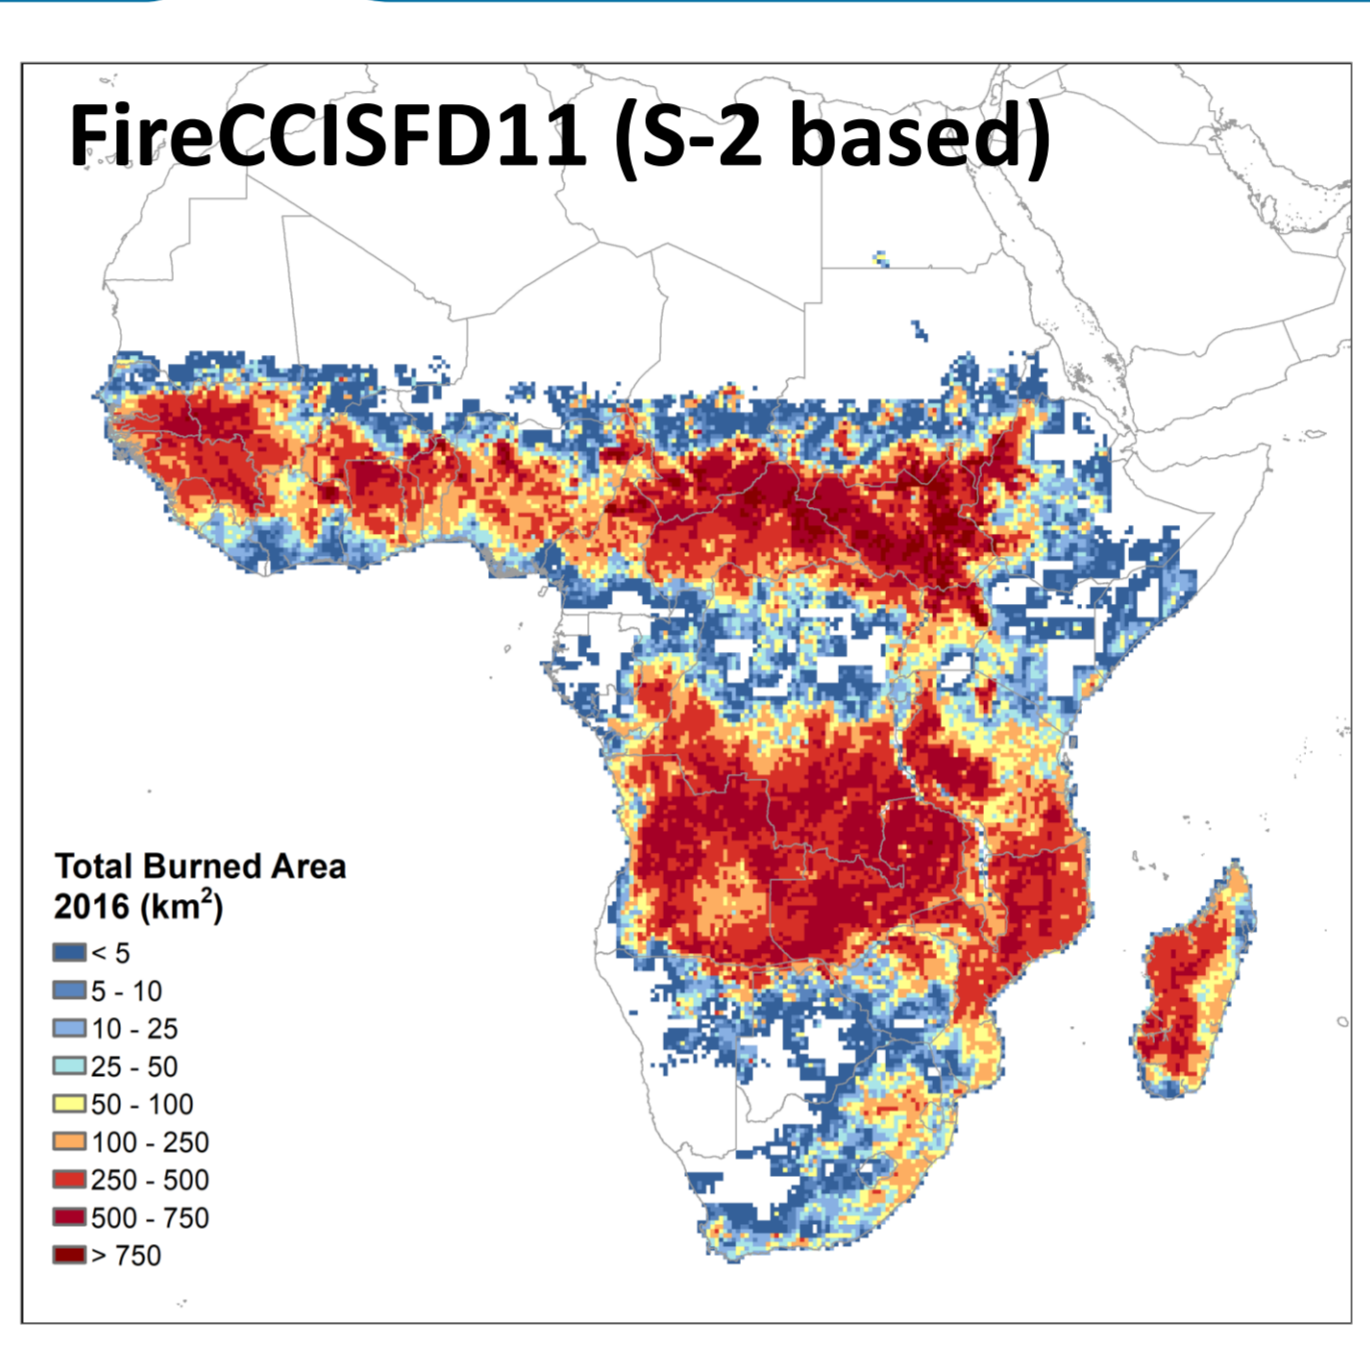

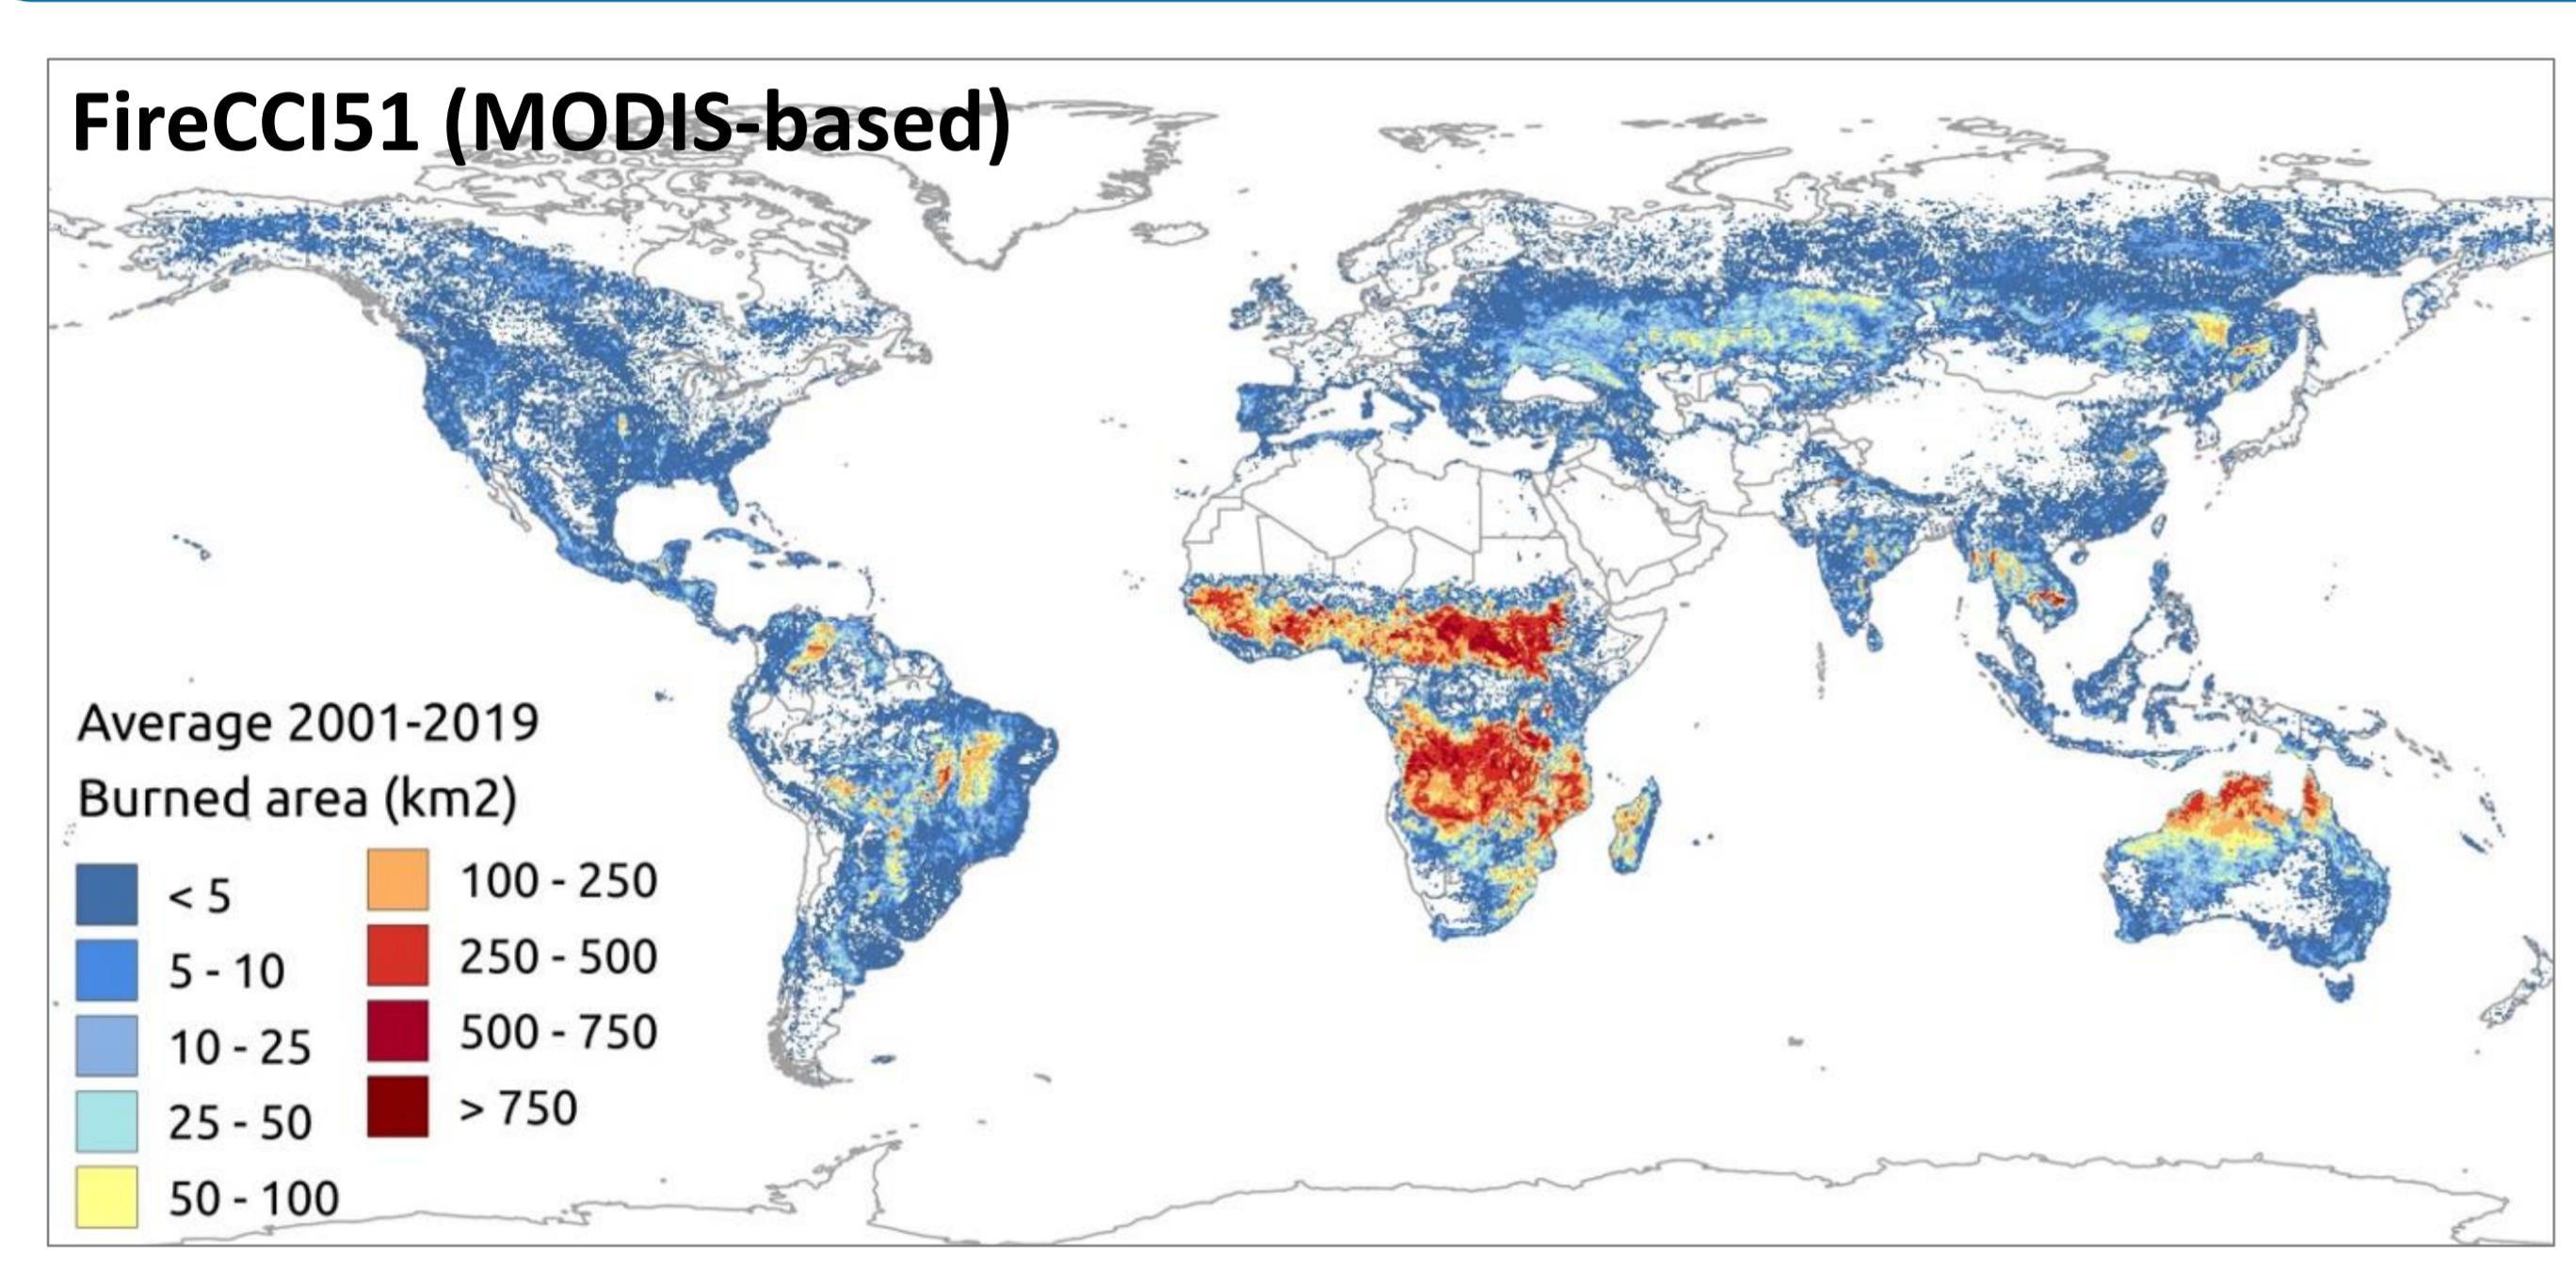

- MODIS FireCCI51: 2001-2019, 250 m & 0.25 degrees
- AVHRR FireCCILT10: 1982-2017, 0.25 degrees

### Regional

- Africa: S-2 MSI FireCCISFD11: 2016, 20m
- Africa, Amazon & Indonesia: SAR regional BA products

## Highlights:

- First ever global BA product based on MERIS 300m.
- First ever global BA product based on MODIS 250m.
- First ever global BA product based on LTDR time series.
- First ever S-2 BA product covering a continent (Africa).
- First ever S-1 BA product covering a large area (Amazon).
- First ever spatio-temporal validation of BA products.
- All products adapted to the climate user needs.
- Strengthen the EO fire European community.
- European-generated BA datasets are now credible to the international community.

## Fire CCI recent developments

### BA Algorithm developments:

- Adaptation to S-3 sensors: SYN
- Integration of S-1 and S-2 sensors.

### Validation:

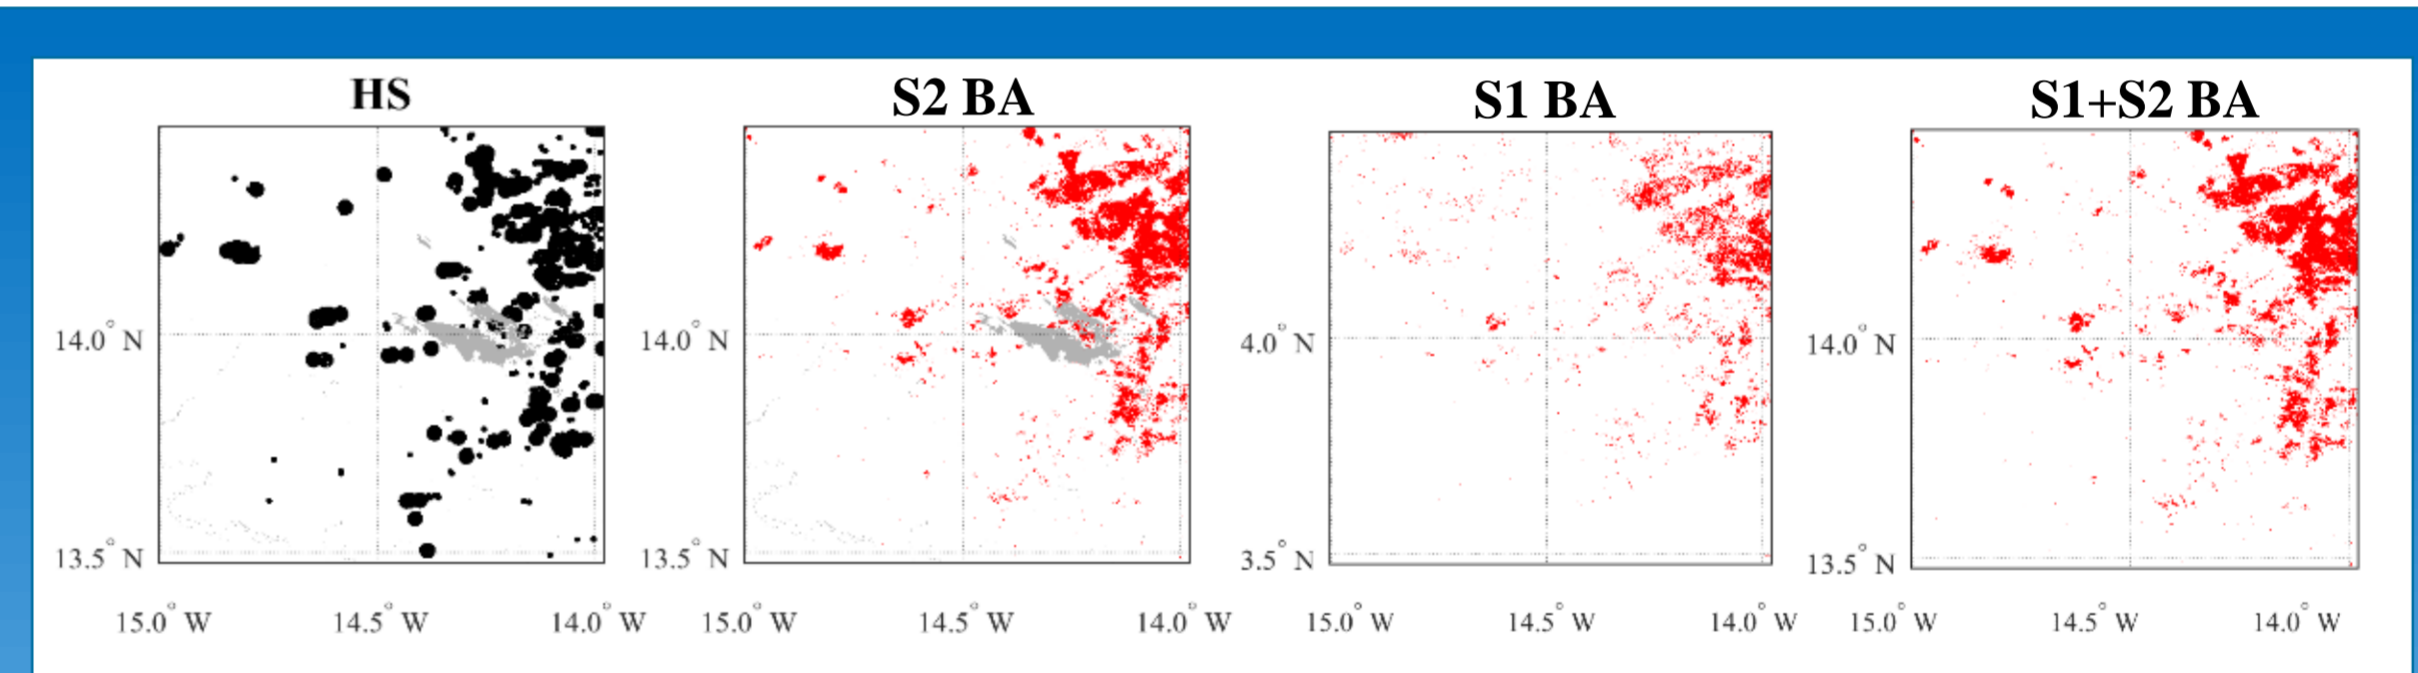

- Global sample based on Landsat OLI.
- Regional sample based on S-2 and Planet.

### Product assessment:

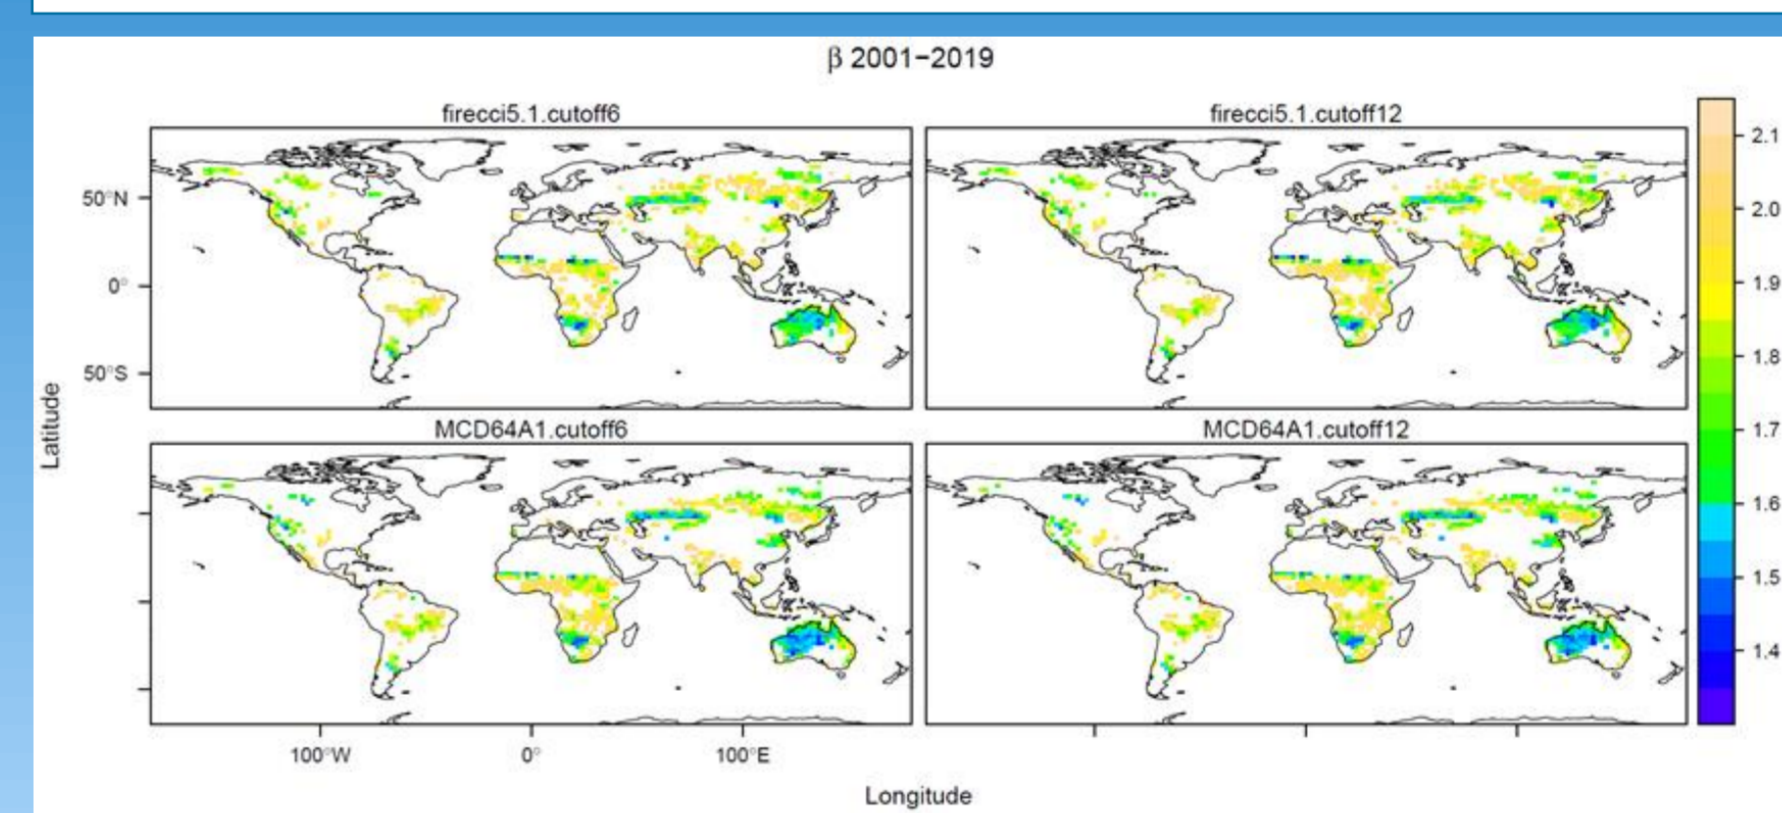

- Atmospheric emissions from chemical models and MOPITT
- Global fire size distribution analysis based on power-law fits

### Product dissemination highlights:

- Fire CCI presentation at COP25 Madrid.
- FireCCI51 now available at Google Earth Engine.
- Nature paper on Australian extreme fires (2019-2020).

Integrated SAR (S1) & Optical (S2) algorithm based on Convolutional Neural Networks (CNN).

**Wildfires: Australia needs a national monitoring agency**

David Bowman, Grant Williamson, Marta Yebra, Joshua Lizundia-Loiola, Maria Lorena Pettinari, Sami Shuk, Ross Bradstock & Emily Chown

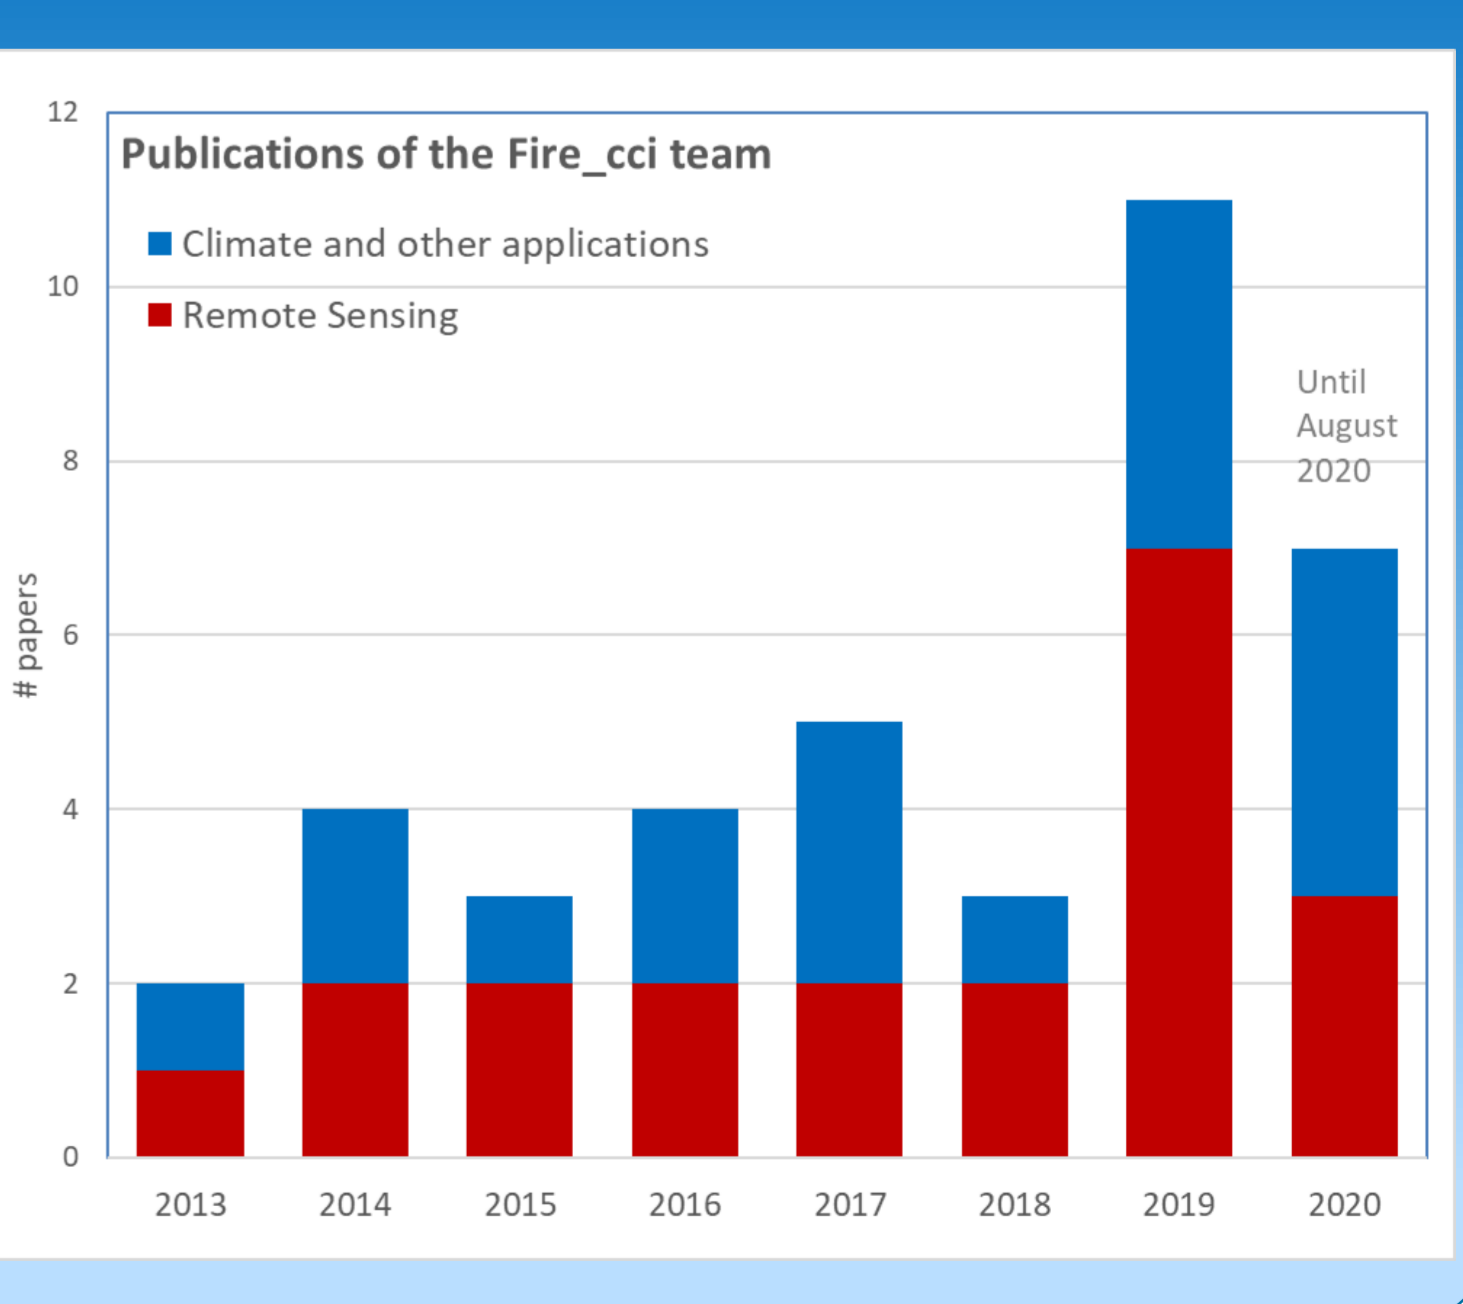

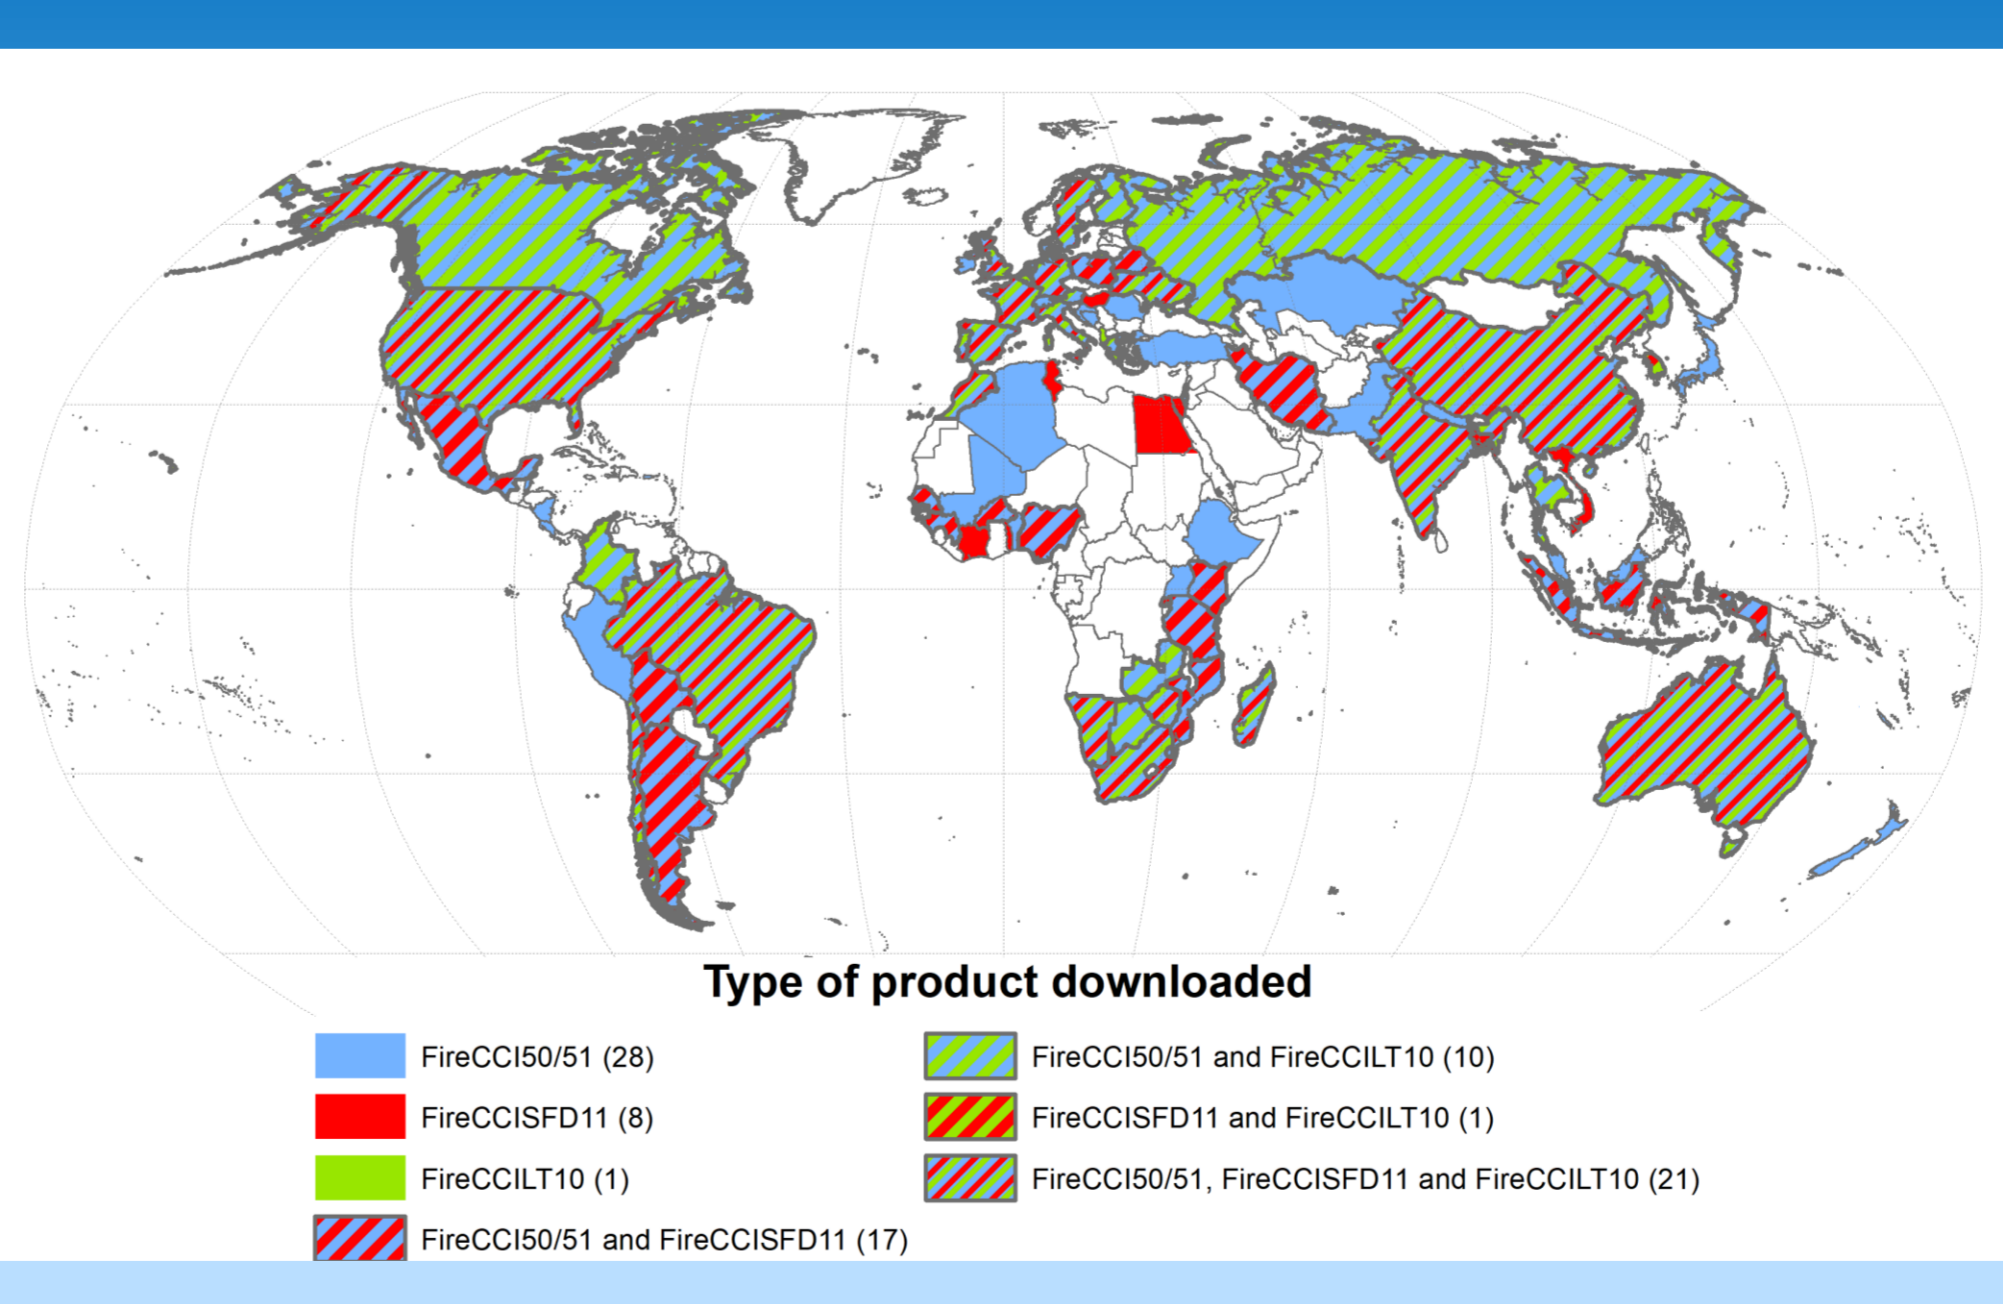

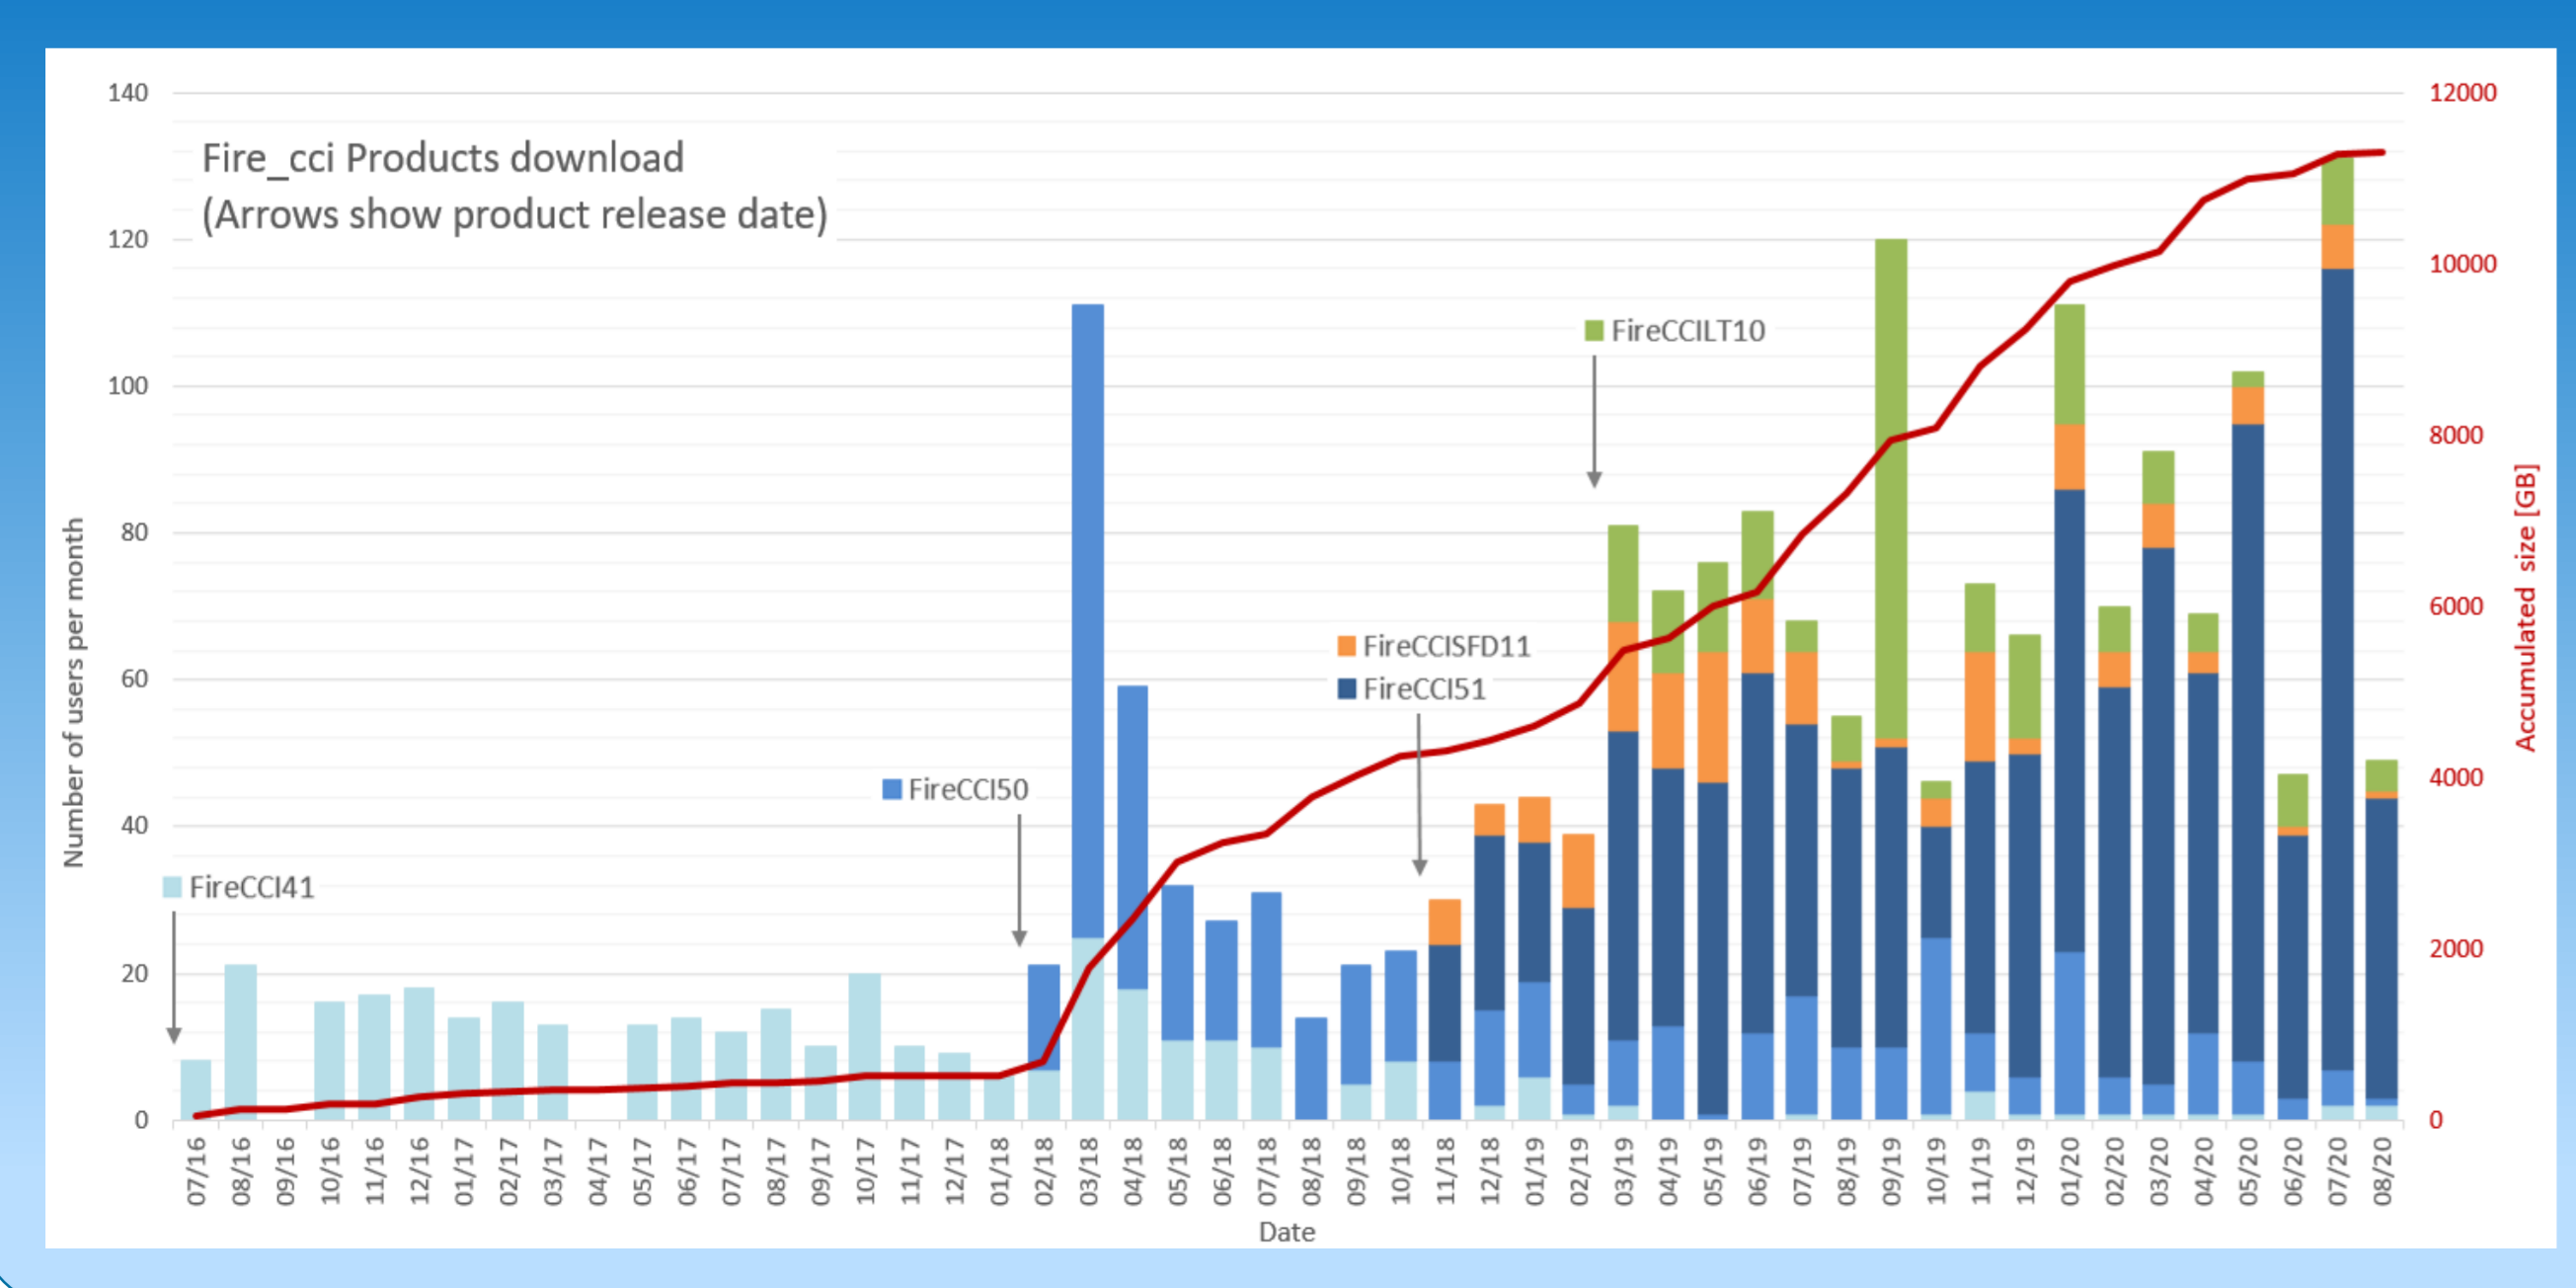

Comprehensive fire surveillance will strengthen resilience and adaptation to climate change.

Just as Australia's 2019-2020 bushfires have shown, the world's fire-prone regions are facing a crisis. The 2019-2020 bushfires in Australia have been a stark reminder of the need for a national agency to coordinate fire monitoring and management. Many Australian bushfires have not been recorded, and the lack of a national agency means that the fire service is not equipped to monitor and manage the fires. A national agency would provide a central system for gathering and storing essential data on bushfires, and would coordinate between the fire service, state and territory governments, and other agencies with similar responsibilities. This would be a major step towards a national fire monitoring agency.

Emission inventories were fed in the atmospheric chemistry transport model WRF-Chem and simulated atmospheric concentrations were compared with satellite observations and aircraft/station measurements. Despite the FINN inventory has the lowest CO fire emissions of all fire emission inventories (shown in the right panel), simulated WRF-Chem CO concentrations over west Africa are substantially overestimated when compared to, e.g., MOPITT satellite observations.

## Project Impact
